BHARGAVI GUDISA

(561) 987-0286 | bhargavi4044g@gmail.com| USA

PROFESSIONAL SUMMARY

Systems and data analyst with 5 years of IT experience in the US and India, working on cloud infrastructure, infrastructure as code (IaC), migration and governance across the software development lifecycle (SDLC). Builds Docker and Terraform environments on GCP and Linux, with project work on Microsoft Azure and Microsoft 365. Sets up content governance with automated audits and runs AI quality review with human-in-the-loop checks. M.S. in Computer and Information Sciences

SKILLS

Infrastructure & Cloud: Infrastructure as Code (IaC), Terraform, Docker, GCP (Cloud Functions, storage, compute), Linux, Microsoft Azure (Data Factory, Synapse, Azure SQL, App Service), Git, GitHub, version control
Governance & Delivery: SDLC, governance processes, data migration and conversion, testing and validation, design and code reviews, technical documentation, training and knowledge transfer, agile delivery, Jira, Asana, cross-functional teams
AI & Integration: AI quality evaluation, human-in-the-loop review, Microsoft Copilot Studio, REST APIs, SaaS integration (Workato, Make, n8n), Power Automate, SharePoint Online, Microsoft 365
Languages & Data: Python, SQL (T-SQL), Bash, Microsoft SQL Server, Azure SQL Database, ETL, data validation, Tableau, Power BI
Databases & Reporting: Microsoft SQL Server, T-SQL, Oracle PL/SQL, relational database design, data modeling, indexing and query tuning, SSRS, Power Query, DAX, Excel, data dictionaries

PROFESSIONAL EXPERIENCE

Software Engineer | Lumin Innovations **May 2025 – Present**

- Built a Python and Bash ingestion application, packaged it in Docker, and provisioned its GCP storage and compute with Terraform, so every Linux environment runs the same version-controlled build.
- Set up governance for knowledge-base content with an owner per area and Jira-tracked reviews each release; automated Bash audits route 200+ stale entries a month to owners and cut staleness by 45%.
- Built Python and Bash tools that analyzed 5,000+ AI-generated chat responses, flagging quality gaps at 98% accuracy in remediation reports that engineers reviewed to prioritize fixes.
- Designed a root-cause process that separates content gaps from prompt-handling failures, so engineers check one cause per failure instead of both; debugging time fell 30%.
- Evaluated, configured, and integrated SaaS automation platforms (Workato, Make, n8n) into content and training workflows, replacing manual handoffs between teams with automated triggers.
- Reported AI accuracy and adoption to executives monthly through Tableau dashboards and set cross-functional priorities in Asana, work that lifted response precision by 25%.

Systems Analyst | Florida Atlantic University **Aug 2024 – May 2025**

- Designed a layered GCP ingestion system with Cloud Functions and Terraform that separated collection, processing, and storage, so new data sources were quick to onboard.
- Deployed the pipeline in Docker on Linux virtual machines and optimized its Bash metadata extraction scripts, keeping development and production consistent and cutting environment-specific failures.
- Defined quality criteria for AI system responses and built a 500+ case edge-case test dataset, giving each release a repeatable, traceable test baseline.
- Worked with documentation owners in Jira to fix low-confidence knowledge articles, raising search success by 18%; content audits cut outdated entries by 40% and saved about 15 hours of manual review a week.
- Ran cross-team workshops in Teams and Asana to align system output with institutional policies, reducing policy-related escalations by 22%.
- Wrote monthly error-trend reports that informed roadmap priorities, and built training modules, webinars, and video tutorials for distributed users.

Project Engineer | Wipro Limited **Jan 2021 – Oct 2023**

- Containerized the QA framework with Docker and extended Terraform configurations for GCP, cutting manual setup as test volume grew and speeding developer onboarding.
- Migrated data processing scripts to Bash on Linux servers, making them portable across environments and laying the base for later GCP pipelines.
- Ran automated test execution and pre-release validation across the SDLC, and joined engineers in design and code reviews to check changes against quality specifications.
- Reviewed chatbot replies as the human check on AI output, flagging inaccurate information to protect data integrity across the conversational platform.
- Designed and documented workflow logic for early AI assistance tools, and created a centralized knowledge-base checklist that reduced documentation errors by 15%.
- Coordinated sprint planning in Jira and Asana across global teams in multiple time zones, and built Tableau dashboards that gave leadership one view of program performance.

PROJECTS

Record Retention Advisor, Town of Morrisville, NC, USA | Microsoft Copilot Studio, Microsoft 365

- Built and configured a Microsoft Copilot Studio agent that answers Town staff questions on how long to keep municipal records and how to handle them when retention ends.
- Grounded the agent in the Town's records retention schedule through its knowledge sources and topics, replacing manual schedule lookups with a conversational interface in Microsoft 365.
- Set each answer to point staff to the matching schedule entry, so a person can check the source before acting on it.

Coffee Sensory Quality Data Pipeline | Python, Pandas, Azure SQL Database, Power BI, GitHub

- Built a Python pipeline that cleans the public Coffee Quality Institute dataset (1,300+ Arabica cupping reviews), applies data quality rules, and loads it into Azure SQL Database.
- Logged every rejected record with the rule it failed, so each loaded score traces back to its source row and no record drops silently.
- Published data lineage and a data dictionary on GitHub so other analysts can reuse the model.

Permit Request Tracker | C#, ASP.NET Core MVC, Entity Framework Core, SQL Server, Azure App Service, GitHub

- Built a web application in C# and ASP.NET Core MVC where staff log, assign, and close permit requests, using object-oriented models and Entity Framework Core over SQL Server.
- Designed the normalized schema, wrote a T-SQL conversion script that migrates sample legacy records from CSV, and added indexes checked with before-and-after execution plans.
- Built HTML, CSS, and JavaScript forms with client- and server-side validation, and deployed the app to Azure App Service with source on GitHub.

EDUCATION

M.S.Computer and Information Sciences | Florida Atlantic University | GPA 3.86 **Dec 2025**

Relevant Coursework: Cloud Computing, Database Systems, Big Data Analytics, Machine Learning, Data Mining, Data Visualization

CERTIFICATIONS

Microsoft Certified: Azure Fundamentals | Statement of Achievement in Programming Essentials in Python
